Activity Summary:
Youth will learn what is in a landfill. Younger youth will learn about the composition of a landfill by looking at a bar graph representation. Older youth will then take the data and create their own graphs.

This lesson plan was modified by the Keep Austin Beautiful Education Team for at-home learning.

UNIT: Generation Zero

GRADES: Kindergarten and Up

MATERIALS:
- 100 small items about the same size (see Lesson Prep section in lesson plan for more information)
- 2 Sheets of paper
- Pencil
- Scissors

OPTIONAL:
- White board and marker
- Calculator
- Microsoft Excel or Google Sheets
- Coloring materials

TIME REQUIRED: 60 minutes

OBJECTIVES:
Youth will be able to:
- Divide waste into three categories of recyclables, compost, and landfill waste
- Describe where our waste should go

TEKS CORE CONCEPTS:

Science
- K: 2ABD, 3ABD
- 1st: 1B, 2ABCD, 3AB
- 2nd: 1B, 2ABCD, 3ABC, 7C
- 3rd: 1B, 2ABCD, 3B, 7D
- 4th: 1B, 2ABCD, 3B, 5A, 7C
- 5th: 1B, 2DG, 5A, 9C
- 6th: 1B, 2DE, 3A
- 7th: 1B, 2DE, 3A
- 8th: 1B, 2DE, 3A

Math
- K: 1A-G, 2A-I, 8ABC
- 1st: 1A-G, 4A, 8ABC
- 2nd: 1A-G, 3ABC, 4ABC, 10A-D
- 3rd: 1A-D, 3ACD, 8A
- 4th: 1ABCE, 2G, 3ABC, 9A
- 5th: 1A-F, 2A, 3J, 9AC
- 6th: 1A-G, 3D, 4DEG, 5ABC, 12D
- 7th: 1A-G, 3A, 6BG,
- 8th: 1A-G, 2A

Lesson Prep (10 minutes)

1. Before you start the activity you will need 100 small items that your youth will be able to organize into 9 categories.
   - Choosing your items:
     a. You will need items that are around the same size, but vary in some way. Use whatever you can find at home! Think about things like Legos, coins, paper clips, cereal pieces, leaves, dog or cat kibble.
     b. You can also have youth cut out pieces of paper and color them!
     c. Figure 1 in the Additional Information section at the end of this document will show you an example of items used and what youth will be doing with them in this activity.
   - You will need:
     a. 27 small items to represent Paper (example uses pink paper clips)
     b. 15 small items to represent Food Scraps (example uses purple paper clips)
     c. 14 small items to represent Yard Trimings (example uses blue paper clips)
     d. 13 small items to represent Plastic (example uses green paper clips)
     e. 9 small items to represent Metal (example uses pennies)
     f. 9 small items to represent Textiles (example uses dimes)
     g. 6 small items to represent Wood (example uses nickels)
     h. 4 small items to represent Glass (example uses quarters)
     i. 3 small items to represent Other (example uses small binder clips)

2. Once you have your items you will need to create a category card set. This will be 9 cards you create that say ‘What the item represents (the category)’ and ‘What you are using to represent it’.
   - For example, your card will read “Paper (Pink Paper Clips)”
   - Figure 2 on the Additional Information section shows an example of the category cards
     a. If you have a youth who cannot read, consider drawing pictures on the cards
What is a landfill? (10 minutes)

1. Ask: What is “trash”? Stuff we don’t use anymore, gross stuff, old things, etc.
2. Where does trash go when we throw it away? Dump, landfill
3. What is the difference between a dump and a landfill? A dump is a big pile of trash (it goes up). A landfill is a hole in the ground they fill with trash (it goes down). See Figure 3 in additional resources for a diagram of the differences.
4. Which is better for the environment dump or landfill? Landfill. Discuss environmental differences.
   - What happens when the wind blows? Trash blows everywhere at a dump, but a landfill is more protected.
   - What about the rain? Trash can wash away easier at a dump.
   - Do you think they both smell? What is going to be attracted to that smell? All kinds of animals.
   - Explain a landfill as a space that has many layers to protect the ground. Have you ever left your trash bag sitting for too long? What gathers at the bottom? Liquid. This liquid is called leachate. Where does that liquid go in the landfill or dump? With no protection the leachate would go into the ground water. A landfill has many protecting layers to prevent this from happening.
5. Introduce the “4lbs” of trash per person concept. E.g. a liter soda bottle weighs about 4.5 pounds.
   - How much trash do you think the average person makes in one day? 4 pounds
   - Think about your class at school, how many students are in your class? 16-22
   - If we multiply that by four, how much trash does the class make every day? 80lbs
   - Ask your youth to represent 80 pounds. Let’s pretend they weigh 80 pounds. How many of them would it take to fill the room they are in? How many days does that represent?
   - What if we included your whole school? The whole city?
6. As the landfill fills up, discuss the potential for lack of space and need to find a new place for trash. Even though landfills are better than dumps, they’re still not great for the environment. They take up a lot of space. We are going to work on putting less in the landfill.
7. To do that, we are going to answer the question, “What’s in a Landfill?”

What’s in a Landfill? (15 minutes)

1. Ask your youth to name items they have recently thrown out. Guide your youth to give answers that cover all of the categories of the activity (categories are what are written on your category cards). Commonly missed answers:
   - What if the table you are working at right now were to break? Would we throw it away? What is it made out of? Category: Wood
   - Do you do chores in your yard? Cut grass, rake leaves. Category: Yard Trimmings
   - Do you like pickles? What do pickles come in? Jar. Category: Glass
   - Do you get holes in your socks? Socks. Category: Clothing/ Textiles
   - Do you have a baby sibling? What do they make a lot of? Diapers. Category: Other
2. Discuss categorizing the items to have a better idea of what we throw away.
   - We could list items all day, but which is easier, a whole list of trash items or nine categories of trash? Categories.
   - Let’s come up with some good categories, so that anything else we could think of will fall into one of them. Do you see anything in common with these items listed?
   - Categories: Paper and paperboard, food scraps, plastic, metal, glass, wood, other, yard
Waste by the Numbers Activity (15 minutes)

1. We are going to do an activity to answer the question, “What’s in a Landfill?”
2. First you will focus on the category cards (see Figure 2 in additional information section for an example), put your collected items aside. Youth will line the category cards up along one edge of their table (or floor if you need more room!).
   - Put the cards in order from what you think we throw away the most to the least
   - Once the cards are placed, do not move them
3. After you have decided on the order of the category cards, you will want to get your items. The items should not be in any sort of order, just one pile
4. Youth will now organize the items to the match the category cards! Lay out your items across the table in line with the category cards.
   - Have youth count how many items there are for each category card and record their answers
5. Ask youth about the results. Refer to the data:
   - What did we just make? A bar graph
   - What does it show us? How much of each category we throw away?
   - What is a bar graph really good for? Comparing and contrasting
6. Ask several data interpreting questions. Be sure to follow up with “how do you know that?” and look for responses that justify the critical thinking behind their answers.
   - What kind of trash do we produce the most of? Paper
   - What kind of trash do we produce the least of? Other
   - Do we produce more or less plastics than metal? Plastic > metal
   - Do we produce more or less food scraps than paper? Food scraps < paper
   - Which material is greater than plastics but less than food scraps? Yard trimmings
7. Allow youth the opportunity to do some math- add up the numbers recorded for each category to get a grand total. Help them get to 100 if needed.

Extensions for Older Students:

1. Youths will graph the data as a bar graph and a pie chart on Excel. See the Additional Resources below for full instructions on how to make a bar graph and pie chart on Microsoft Excel and Google Sheets.
2. Explain how each number of items per category represents a part of a whole.
   - How many items were there total? 100
   - How many items representing paper were there? 27
   - How much does the paper make up out of the total? How is this written mathematically? Fraction. 27/100.
3. Demonstrate how fractions can also be represented as decimal and then as percentages. Illustrate this on the board. Model this with several different categories.
   - What is another way of writing a fraction? Decimals. 0.27.
   - Is there another way? Percentages. 27%
   - Practice writing the fractions, decimals, and percentages for several other categories.
Closing (5 minutes)

1. Ask youth to tell you what they were looking at in this activity. What did the items represent? The items represent what we are throwing in our trash can, and what they are finding in the landfill.

2. Looking at the categories we created in the activity and determine which categories can be recycled, composted, re-used etc.
   - Do all of these items have to go into the landfill? Which categories can we send elsewhere?

3. Go category by category and mark each as Compostable, Recyclable, Re-useable or Landfill:
   - Metals, Glass -> Recyclable
   - Food Scraps, Yard trimmings -> Compostable
   - Paper -> Compostable and Recyclable
   - Plastic -> Recyclable (With advanced youth note 2% of plastics are Landfill trash only)
   - Textiles -> Most can be reused in some way
   - Wood-> Re-use, landfill
   - Other -> Mostly landfill, though some can be recycled in a special place.

4. We’re only left with Wood and Other. How much does Wood equal? 6% How about Other? 3% How much is 6 + 3? 9. That’s all we should be putting in the landfill. How much should we NOT be putting in the landfill? 91%

5. Introduce the City of Austin’s Zero Waste Initiative.
   - Goal in Austin to divert 90% of our waste from the landfills by year 2040.
   - Ask youth to calculate how old they will be in the year 2040. Prompt them: in how many years will it be 2040? What is your age plus 20? That is how old you will be!

6. Is it possible to meet the Zero Waste Goal?
   - Yes! We just need to learn how to compost and recycle as best as possible.

7. CHALLENGE youth to check their trash can and see what they throw away the most. Does it actually belong in the trash can?

Waste by the Numbers Activity Set Up:

Figure 1 Finished Activity

Figure 2 Sample Category Cards

Landfill Vs Dump Diagram

Figure 3 Visual for dump vs landfill
Figure 4 Waste by the Numbers Pie chart
Waste by the Numbers

How to Graph in Microsoft Excel:

First Steps:
1. You will need to open a new sheet in Microsoft Excel
2. In column A, you will type each category in their own row (look at rows 1-9)
3. In column B, you will type the number of items for each category
4. Highlight all the data in your spreadsheet. To do this (left) click into the A1 and drag your mouse to highlight all of your data.
5. While keeping your data highlighted click on the “Insert” tab on the top of the page.
6. Then you will want to click on the bar graph picture, if it gives you options click the “2D Cluster Column Chart”
7. A bar graph should pop up on your screen!
8. You have successfully created a bar graph of your data.

9. We will now make a pie chart.
10. Highlight all the data in your spreadsheet. To do this, (left) click into the A1 and drag your mouse to highlight all of your data.
11. While keeping your data highlighted click on the “Insert” tab on the top of the page.
12. Then you will want to click on the pie chart picture, if it gives you options click the “2D Pie Chart”

13. You have created a pie chart!
14. Now you can play around and add a title, axis titles, change the colors.
15. Compare and contrast your graphs!
How to Graph in Google Sheets:

First Steps:
1. You will need to open Google Drive and go into Google Sheets
2. In column A, you will type each category in their own row (look at rows 1-9)
3. In column B, you will type the number of items for each category

4. Highlight all the data in your spreadsheet. To do this (left) click into the A1 and drag your mouse to highlight all of your data.
5. While keeping your data highlighted click on the “Insert” tab on the top of the page.
6. Then click on “Chart”
7. On the right hand side of your screen you will see a ‘chart editor,’ in this editor you can choose the type of chart you want. Click Pie Chart.

8. You have successfully created a pie chart for your data!

9. You will now make a bar graph. To do this you will follow steps 4-6.

10. Once you have clicked on chart, you will click on the drop down under chart types. You will see different chart options.

11. Click on column graph or bar graph.

12. You now have successfully created two graphs.

13. Play around with the graphs adding titles, changing colors etc.

14. Compare and contrast your graphs!
Background Information:

Municipal Solid Waste (MSW): What is it?
In 2014, Americans generated approximately 258 million tons of trash, and they recycled and composted over 89 million tons of this material. This is the equivalent to a 34.6 percent recycling rate. On average, we recycled and composted 1.5 pounds out of our individual wasted generation of 4.4 pounds per person per day. (Source: epa.gov) Municipal solid waste is made up of the things we commonly use and then throw away. These include packaging, food scraps, grass clippings, sofas, computers, tire and appliances. This trash does not include industrial, hazardous or construction waste. Municipal waste may also include sludge and septic waste. (Source: epa.gov)

Municipal Solid Waste in Texas
According to the Texas Natural Resource Conservation Commission, Texans dispose of approximately 21 million tons of municipal solid waste per year and pay more than $1 billion each year for the management of it. A study conducted for the Texas Water Commission (now the Texas Natural Resource Conservation Commission), found 63% of the MSW generated in Texas is residential and 37 percent is commercial or institutional. Municipal solid waste is disposed of through landfills, incineration, waste-to-energy facilities, and land application (for sludge). Recycling and composting are also used to manage municipal solid waste. In Texas as in most other places in the U.S., landfill disposal is still the predominant method of solid waste management.

An average Texan generates about a pound more per day of municipal solid waste than the national average of 4.4 pounds per person per day. The discrepancy between the amount of solid waste generated and the amount disposed of is due to several factors, including the use of recycling and composting. According to the Texas Natural Resource Conservation Commission, if the total amount of all types of waste - including construction, demolition debris and sludge - received by municipal solid waste facilities in Texas is considered, the per capita disposal rate is to about 6.7 pounds per day. So we have our work cut out for us! (Source: Texas Natural Resource Conservation Commission, Municipal Solid Waste Division)

Categories of Waste
There are about 3,000 active landfills in the United States and they are filling up fast. What is it that is filling up our landfills? Half of the waste that goes into landfills is packaging! The EPA conducts annual studies to identify the composition of the American Municipal Solid Waste.

Interpreting Graphs and Charts
Graphs and charts display data so that it can be easily understood. You can use graphs and charts to compare sets of data. A bar graph uses bars to show data. The bars on a bar graph can be horizontal or vertical. A pie chart is a circular graph which visually represents percentages or proportions. For this lesson the composition of trash will be illustrated in both a bar graph and a pie chart.
**Austin's Single Stream Recycling**
As residents, it is our job to separate the recyclables and compostables from landfill waste and make sure to get it the curb on the appropriate pick up day. The City of Austin offers a single-stream recycling program, so all recyclables go in a 90-gallon blue cart that is collected every other week.

**Austin's Zero Waste Initiative**
By 2040, the City of Austin hopes to divert or “recover” 90% of all waste. This initiative has been adopted by one or more cities in California, New York, Colorado, Texas, Washington, North Carolina, and Hawaii. The goal of Zero Waste is to systematically eliminate waste in a landfill by changing the production, distribution, and processing of materials, providing comprehensive collection of refuse, and reclaiming waste into usable resources. Zero Waste implementation also eliminates environmental hazards of waste in natural environments such as groundwater, soil, and air pollution.

On the residential side of Zero Waste, Austin has started to implement a 3 bin collection system: organics (the green bin), recyclables (the blue bin), and landfill trash (the brown bin). The City has also built a complex drop off center for all waste products: household hazardous waste (paint, lawn chemicals), bulk material appliances, single stream recyclables, and organics. The facility is called the Recycle & Reuse Drop off center, which provides all residents and small businesses from any area of Austin a central location to dispose of materials. Above all, public education on resources and proper disposal methods will allow many more materials to be recovered.

**Useful Definitions:**

<table>
<thead>
<tr>
<th>Trash/Waste/Solid Waste</th>
<th>Any unwanted or discarded material that is considered useless.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dump</td>
<td>An unprotected site where people would dispose of all types of waste, including hazardous waste. A dump is typically ill-equipped as they produce leachate that can harm groundwater, become a congregation spot for insects and rodents, and can pose health threats. Leachate is a combination of liquid (mostly water) that runs through a trash site that picks up contaminants from the waste as it passes by. You may have heard the term “dumpster juice,” this is an example of leachate.</td>
</tr>
<tr>
<td>Landfill</td>
<td>A carefully engineered site for the safe disposal of solid waste. Modern landfills are equipped with collection systems for groundwater contaminants, methane gas controls and environmental monitoring systems.</td>
</tr>
<tr>
<td>Recycling</td>
<td>The collection and reprocessing of a material for use in the manufacturing of a new product.</td>
</tr>
<tr>
<td>Single Stream Recycling</td>
<td>A type of recycling program where people can throw mixed items in one bin such as paper, plastic, cardboard, and glass.</td>
</tr>
<tr>
<td>Composting</td>
<td>The collection of organic materials to be turned into soil. Organic materials are those that are from the earth, or that were once living. For example, an apple came from the earth and was once growing on a tree.</td>
</tr>
<tr>
<td>Bar Graph</td>
<td>Uses horizontal or vertical bars to visually represent percentages or proportions.</td>
</tr>
<tr>
<td>Pie Chart/Graph</td>
<td>A circular graph which visually represents percentages or proportions.</td>
</tr>
</tbody>
</table>
